

# **Bike Winnipeg Executive Directors Report**

## **March 10, 2015**

### **City of Winnipeg Infrastructure Projects**

#### **CPR Yards Crossing Study**

We organized a workshop for people to come out and discuss the project, and in particular where they wanted to be able to bike to within the study area, and what type or crossing options would be appropriate for themselves and their family, friends and colleagues. About 10 people turned up, and we got some good input (see report at end).

We completed the 5<sup>th</sup> public advisory committee (PAC) meeting today. A range of options are being considered for the crossing, with various levels of impact on the community, transit, walking and cycling routes.

There will be another public workshop on Saturday March 21<sup>st</sup> to be held in the library at King Edward School (825 Selkirk Avenue).

- workshop will run from 12 noon to 4 pm
- there will be pizza and refreshments
- child care available
- pickup/drop off available
- See attached for full details.

#### **Bike Map Proposal**

The proposal has been sent in. We will likely have to wait until Kevin Nixon returns from vacation to get a response.

#### **Pedestrian & Cycling Strategies**

A release date for the strategies is still up in the air..

#### **Marion Widening**

No news to report.

#### **Chief Peguis Trail West Extension**

I am expecting that the planned workshops will be arranged soon. I will post information as I receive it.

### **William R. Clement Extension**

The original stakeholders meeting was postponed and will now take place on March 18<sup>th</sup>. A public display information session has been scheduled for:

- Thursday March 19<sup>th</sup> – 4:30-7:30pm
- Canadian Mennonite University
- 500 Shaftesbury Boulevard
- Located in the Chapel
- Drop in Format

### **Ruby/Banning Corridor**

I have received the active routes to school engineering report from Green Action Centre, and just have to compare our recommendations with those from this report. I will then send it forward to the City Councillor (Cindy Gilroy) and MLA (Rob Altemyer) before sending it forward to the city.

### **Finance**

The Executive committee went over a draft budget, and Bill and I followed up to refine the budget. We still need some work before we are ready to finalize things. In particular, we need to refine our numbers for the National Bike Day event, and we need to work out priorities for our expenses, so that they can be linked to revenue deadlines (i.e. what do we drop 1<sup>st</sup> if money does not materialize). We also need to go through the budget and set out a cash flow timetable for the year (which will help with prioritization).

### **Advocacy**

#### **City of Winnipeg 2015 Budget**

I am signed up to speak on March 16<sup>th</sup> and 17<sup>th</sup>. Charles helped organize a meeting of organizations interested in pedestrian and bicycle issues, which was well attended. This should get more voices out to help us in a bid to increase funding, at least over the long term.

### **Encouragement**

#### **Downtown Protected Bike Lanes Pilot Project**

We need to work on involving the Downtown and Exchange District BIZ's, get a budget together, and develop some base ideas that can be brought forward to the April meeting.

# **Bike Winnipeg CPR Yards Crossing Workshop Notes**

## **Tuesday February 24<sup>th</sup>**

### **Sinclair Park Community Centre**

#### **Factors influencing the decision to bike/not bike and route selection**

- Distance, roadway maintenance, traffic, accessibility of shops, etc.

#### **Convenience**

- Direct Routes are critical
  - This is especially true at transition on and off of any structures, as this has often been a problem with other city projects.
  - Bicycle signals could help at transitions and at major intersections, especially to avoid turning conflicts
  - We do not want to see a repeat of the stop/dismount situations that crop up too often on multi-use paths along the side of roadways
- Advanced Bike counters with integration to activate traffic signals would help make cycling more convenient by reducing wait times at signals.
- There was a strong preference to have people on bikes accommodated on the major routes so that they would get the advantage of traffic signals
  - Setting signals to accommodate a “green wave” would be beneficial, and would also create slower travel speeds that would also add to neighbourhood livability.
  - Where people on bikes are to be accommodated on minor roads, there needs to be a way to get a quick signal change at major roads.
    - Pedestrian corridors provide a quick crossing option
    - It was noted that waiting times at some of the half signals installed in the city can be too long to garner compliance.

#### **Safety/Comfort**

- Separate People on Bikes from People on Foot and People in cars/trucks/buses
  - Two one way protected bicycle lanes are preferred to one two way protected bicycle lane; better access, less conflict especially in the tighter grid network prevalent in the study area.
  - Jersey barriers or something similar should be used for separation – think Maryland Bridges, Norwood Bridge
- Good quality lighting needs to be included
  - Potentially integrated into railings
  - Consider integrating a “green wave” into lighting
  - Good sight lines are critical, lots of room to provide a wide buffer or to turn around
  - Providing multiple access points to the roadway, especially on the approaches would increase social safety.
  - Consider plantings, such as on the Norwood Bridge. If these were kept low enough, and with enough gaps, they might also help create a barrier that would add to the social safety of any bridge (they could create a separator between users).

- There was a definite preference for bridges over tunnels, at least for people on foot or bike
  - Social safety was the main reason given for the preference
  - Fumes and noise were secondary reasons
  - There was a dissenting voice in the online feedback that voiced a strong preference for tunnels, pointing out the mechanical advantage they offer over bridges (beyond the height and slope advantage of a tunnel over a bridge, you also approach the tunnel with a downhill, which means it is easier to commit to the climb at the end rather than at the start as with a bridge).

## General comments on crossings

- Include rest spaces with benches at the top to watch the trains
- Wind protection would be a bonus
- If all modes are mixed in a single structure, it would be beneficial if people on bikes and foot could be raised above the traffic level (Pembina Underpass)
- Mechanical aids similar to the one used in Trondheim, Norway would help encourage more people to bike (see video here: <https://www.youtube.com/watch?v=7j1PgmMbug8>, see a second video [here](#) ). It was manufactured by a ski lift company.
- Visibility/Wayfinding
  - We discussed the need to have intuitive cycling facilities that had wayfinding to help guide people on bikes and prevent others from encroaching into space allocated to people on bikes.

## Potential Crossing Improvements within the Study Area

### McPhillips Underpass

- The existing underpass is a major barrier
- The Hydro right of way to the west of McPhillips could prove useful, especially for people heading towards the St. James Industrial & Polo Park districts.
  - Getting right of way over the tracks would be an issue
  - Social Safety would be an issue
  - An alternative may be to widen the McPhillips underpass

## **Arlington**

- Arlington has excellent potential as a north/south route if protected bike lanes can be installed north and south of the yards.
  - Requires removal of traffic lanes between Notre Dame and Mountain
  - Requires removal of parking south of Notre Dame, but that can be mitigated by building parking bays
  - Potential to connect to a future rails to trails (or rail with trail) project along the Winnipeg Beach Rail Line.
    - Approximately 50,000 people live within 1.2km of the Winnipeg Beach rail line, all with easy low stress access to the rail line via residential streets and pathways.
  - We discussed the possibility of routing vehicular traffic through a tunnel and bicycle/pedestrian traffic over a bridge.
    - Ramps could be used to lessen slopes on approaches/abutments
  - Adding extra vehicular lanes to the Arlington crossing would provide redundancy for vehicular traffic, but would make it hard to provide protected lanes on Arlington, and could have a deleterious effect on the neighbourhoods if it induced additional travel.
- Gaining access for Transit and freight along the Arlington ROW would be useful.

## **Slaw Rebchuk Bridge**

- Using a cantilevered approach to widen the sidewalks into separated bicycle/pedestrian facilities or a multiuse pathway on Slaw Rebchuk
  - A southern connection to Alexander and Ellen looks quite possible.
  - A northern connection is trickier
    - Powers via Jarvis could be a candidate
    - Robinson via Sutherland or Jarvis is another candidate
    - If parallel streets are used as an alternative to Salter, it would make sense to have two way bike paths on both sides of the bridge to match the traffic flow on the parallel streets.
  - If a connection was made between McGregor and Sherbrook, there might be a substantial drop in traffic along Dufferin, which might make it attractive as an east/west bike route.
  - Wind protection would be a bonus

## **We discussed crossing options outside of the study area**

- Disraeli
- Annabella
- Main Street
- Keewatin

## Potential New Crossings

### McGregor/Sherbrook or Tecumseh

#### Conversion of McGregor and Salter into a one-way couplet might be an option

- McGregor would be southbound, Salter would be northbound
- McGregor would connect to Sherbrook via a tunnel
- ~600m distance between McGregor and Salter creates problems for transit users.
  - There would be counter flow transit lanes to ensure transit service was maintained.
- If Sherbrook/Maryland directions were also reversed, the Notre Dame intersection would be simplified.
  - EMS access would have to be figured out.
  - Maryland/Sherbrook could convert back to their current north/south orientations at Wellington.
- Would there be space for protected bike lanes or even painted bike lanes if this was to occur?
  - If each of the one ways was limited to 2 vehicular lanes plus the counter flow transit lane, that would leave room for two one way bike lanes.
    - The bike lanes could be raised or buffered
- The additional crossing would likely reduce traffic on Dufferin, which would allow conversion into a bike route.
- Given the high potential for cycling/walking in the area, this might help encourage a larger shift to transportation by bike.

### Barriers

- Roundabouts would not be appreciated
- Most people would not feel comfortable taking the lane through a roundabout, especially a multilane roundabout.
- Stopping and waiting for traffic if cyclists were not given priority through the roundabout (as they are in the Netherlands) would be a major inconvenience, and contrary to equity.
- Travelling south through the Sherbrook/Notre Dame/Maryland intersection was identified as a major barrier
- The intersection of Bannatyne @ Sherbrook is a barrier
  - A counter flow option on McDermot might help with connectivity
- Connections to McPhillips are bad
- McPhillips itself is a barrier

## **East West Access**

- Alexander can be a good east/west route south of the yards, but we need to see improvements to the connections across major roads.
  - Isabel – Pedestrian corridor cannot be activated by people on bikes, doesn't necessarily leave a clear throughway for bicycles.
  - Arlington
- We wanted to see access to McDermot, preferably with a separated facility along McDermot (at least through the HSC Complex).
- Access to William was suggested as an important route
- Burrows would be good if you can get protected bike lanes.
- Mountain has shops that people on bike would want to reach
- Sutherland/Flora/Pritchard – crossings are problematic

## **Maintenance**

- We need four season maintenance
- Shy lanes have proven to be poorly maintained in spring, fall and winter

*You are Invited to a Community Workshop!*

**Where do *you* picture crossing the CPR Yards  
in the future? Will you bike, walk, bus, drive?  
Plan to come and share your ideas!**

**Saturday, March 21st (12:00 noon - 4:00 p.m.)**

**Community Workshop and pizza/refreshments**

**12:00 p.m. King Edward School library, 825 Selkirk Ave.**

**Pick-Up/Drop-Off Locations**

**11:30 a.m. Burton Cummings Community Centre, 960 Arlington St.**

**11:35 a.m. Rossbrook House, 658 Ross Ave.**

**11:40 a.m. Pritchard Park, 295 Pritchard Ave.**

**11:45 a.m. North End Community Renewal Corporation, 509 Selkirk Ave.**

*Please confirm if you are coming so we can plan the day and to accommodate child-care,  
transportation, and those with disabilities.*

*Reserve your spot by emailing [freig.associates@shaw.ca](mailto:freig.associates@shaw.ca) or contact 311.*

*For more project information, visit [cprcrossing.winnipeg.ca](http://cprcrossing.winnipeg.ca), and click on  
the citizen planner button at the top-right corner and share your thoughts!*

# WILLIAM R. CLEMENT PARKWAY EXTENSION STUDY

## Public Information Display Session

### Project Background

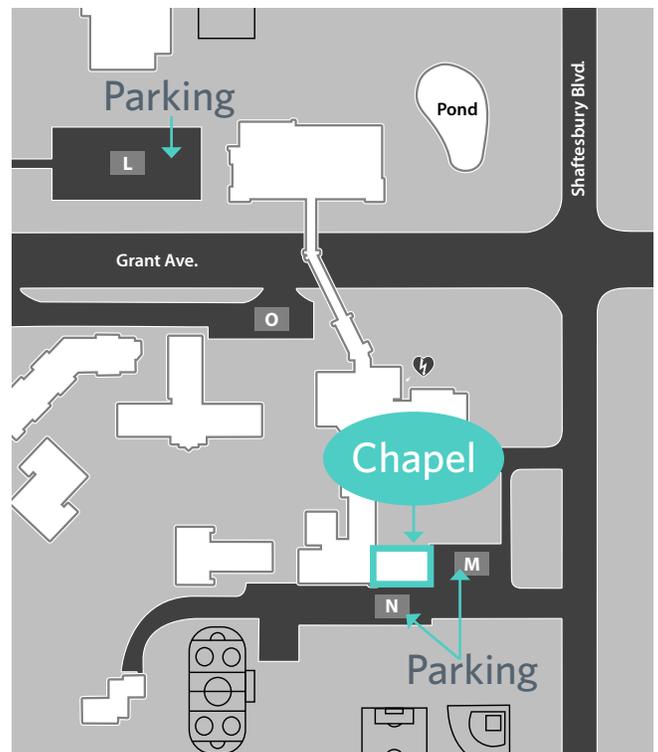

The William R. Clement Parkway (WRCP) Extension is an important component of the City of Winnipeg's future transportation system, providing a north-south link in west Winnipeg. The City's Transportation Master Plan, which guides transportation planning in Winnipeg, includes the WRCP Extension as a major transportation facility, intended to accommodate future travel demand in the area.

### Public Information Display Session

Date:	March 19, 2015
Time:	4:30 p.m. - 7:30 p.m.
Location:	Canadian Mennonite University 500 Shaftesbury Boulevard Located in the Chapel (see map)
Format:	Drop-in

### Canadian Mennonite University Campus Map

Join us at the Public Information Display Session to view presentation boards outlining background information and project details, speak with project team members and provide input.
